Table of contents

Determination of aerobic bacteria

Determination of anaerobic bacteria

Mycological stool examination

pH-value

Digestive residues

Your test results

How to interpret your results

If the circle on the scale is within the green area, your value is good. If the circle is within the yellow or orange areas, it indicates a warning. Some parameters can have too high or too low, in which case the scale starts with the green area, this is completely normal. For an explanation of the various parameters, please see Part I (General information).

Determination of aerobic bacteria

Name	Your value	Unit	Reference value	Scale
Escherichia coli	2,0 x 10 ⁸	CFU/g stool	10 ⁶ - 10 ⁷	
Escherichia coli Biovar	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Proteus spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Klebsiella spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Pseudomonas spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Enterobacter spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Serratia spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Hafnia spp.	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	
Enterococcus spp.	2,0 x 10 ⁷	CFU/g stool	10 ⁶ - 10 ⁷	

Determination of anaerobic bacteria

Name	Your value	Unit	Reference value	Scale
Bifidobacterium spp.	2,0 x 10 ⁹	CFU/g stool	10 ⁹ - 10 ¹¹	
Bacteroides spp.	1,0 x 10 ⁹	CFU/g stool	10 ⁹ - 10 ¹¹	
Lactobacillus spp.	< 1,0 x 10 ⁴	CFU/g stool	10 ⁵ - 10 ⁷	

Name	Your value	Unit	Reference value	Scale
Clostridium spp.	● < 1,0 x 10 ⁵	CFU/g stool	< 1,0 x 10 ⁵	

Mycological stool examination

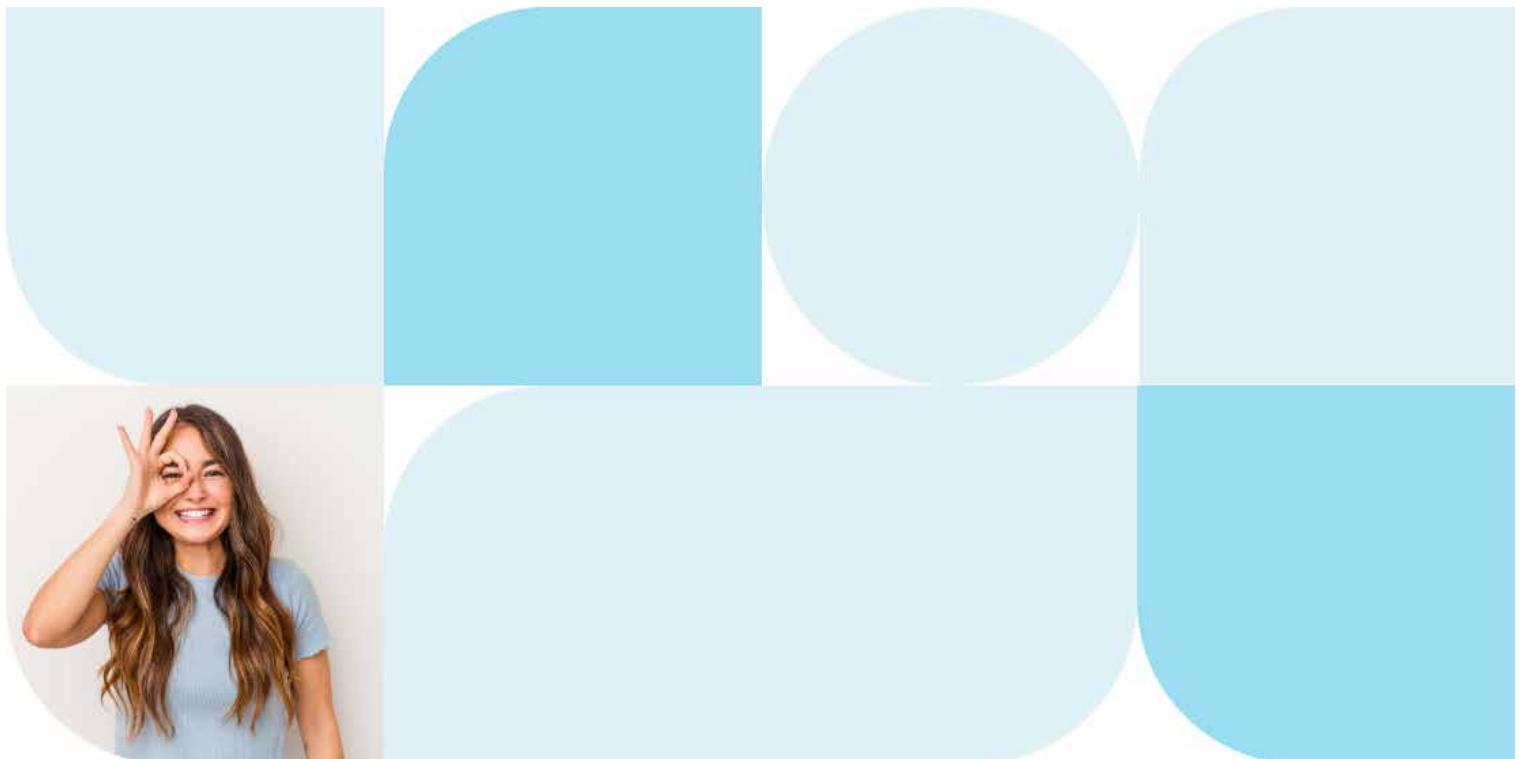

Name	Your value	Unit	Reference value	Scale
Candida spp.	● < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	
Candida albicans	● < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	
Yeast	negativ	Negative		
Geotrichum candidum	● < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	

pH value

Name	Your value	Unit	Reference value	Scale
pH value	● 6.00		5,8 - 6,5	

Mucosal support / Butyrate production

Name	Your value	Unit	Reference value	Scale
Akkermansia muciniphila	● 7800000.00	CFU/g stool	> 1,5 x 10 ¹⁰	
Faecalibacterium prausnitzii	● 16999999000.00	CFU/g stool	> 5,0 x 10 ¹⁰	

Extended Information

Explanation of your test results

The microbiome includes the bacteria and other microorganisms that are naturally present in the intestine. The microbiome helps to maintain human health and disease. It modulates the immune system, provides the organism with vitamins, participates in the digestion of food components, supplies intestinal epithelium with energy by producing short-chain fatty acids and stimulates intestinal peristalsis.

Determination of aerobic bacteria

Escherichia coli

Name	Your value	Unit	Reference value	Scale
Escherichia coli	2,0 x 10 ⁸	CFU/g stool	10 ⁶ - 10 ⁷	

Escherichia coli belongs to the pathogenic bacteria. Pathogenic bacteria are bacteria that thrive in the environment and produce toxins. At high pH, they grow and can compete with other good bacteria.

Pathogenic bacteria primarily metabolize protein and fat, which promotes the metabolism with ammonia, nitrite, urea and hydrogen sulfide. This can damage the intestinal mucosa and may lead to an increase in the pH of the colon (pH 8) in the long term.

Harmful bacteria are often caused by the sensitivity to the intestinal immune system. If the microbiome is damaged due to increased amounts of pathogenic bacteria, it can try to reduce the pH value in the intestine. This can be accompanied with pain problems. This promotes the recruitment of the intestinal immune system and inhibits the growth of pathogenic bacteria. This can mainly be produced enzymes, which reduce the damage on the intestine and other cells caused by the bacteria.

Escherichia coli Biovare

Name	Your value	Unit	Reference value	Scale
Escherichia coli Biovare	< 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

Escherichia coli Biovare is a subspecies of Escherichia coli that does not normally occur in the intestine. These are often found in cattle, humans and horses. It is not uncommon to find Escherichia coli in cattle when testing for Escherichia coli and a higher pH.

Harmful bacteria are often caused by the intestinal immune system. This is mainly due to the production of inflammatory cytokines.

Proteus spp.

Name	Your value	Unit	Reference value	Scale
Proteus spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

High levels of Proteus spp. can often cause intestinal disorders, urinary tract infections, and sepsis.

Klebsiella spp.

Name	Your value	Unit	Reference value	Scale
Klebsiella spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

High levels indicate an increased inflammatory activity in the intestine. Klebsiella spp. values above the normal may cause abdominal pain, bloating, general diarrhea. Elevated levels of Klebsiella spp. may occur after prolonged use of antibiotics.

Pseudomonas spp.

Name	Your value	Unit	Reference value	Scale
Pseudomonas spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

Elevated levels of Pseudomonas spp. may occur in inflammation of the intestine. Elevated levels need to be treated with antibiotics.

Enterobacter spp.

Name	Your value	Unit	Reference value	Scale
Enterobacter spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

Enterobacter spp. belong to the pathogenic bacteria. Enterobacter spp. are bacteria that thrive in ailing environments and gastrointestinal. At high pH, they grow and can compete with other good bacteria. Enterobacter spp. are mainly saprophytic bacteria, which produce many substances such as ammonia, nitrite, nitrate and hydrogen sulfide. This can damage the intestinal mucosa and may lead to an increase in length of diarrhea (1-3) in the long term.

Enterobacter spp. are common bacteria in soil and water and are often found in the intestines of humans and animals. High levels are often associated with intestinal processes in the intestinal tract. Enterobacter spp. opportunists that can occur as pathogens in hospitals, where they cause infections in people with weakened immune systems.

If the intestine flora is threatened by an increased amount of pathogenic bacteria, one can try to reduce the pathogenic bacteria in the intestinal flora by supplementing with pre- or probiotics. This promotes the regeneration of the beneficial microbiota and inhibits the growth of pathogenic bacteria. Lactobacilli contribute significantly to this process, which decreases the damage on the intestinal and other organisms such as the liver and kidneys.

Serratia spp.

Name	Your value	Unit	Reference value	Scale
Serratia spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

Serratia species cause the variety of infections. Bacterial food poisoning often occurs in people with diarrhea.

Hafnia spp.

Name	Your value	Unit	Reference value	Scale
Hafnia spp.	● < 1,0 x 10 ⁴	CFU/g stool	< 1,0 x 10 ⁴	

Bacterial toxins of Hafnia species can occur in people with diarrhea without causing disease (those in people with no diarrhea).

Enterococcus spp.

Name	Your value	Unit	Reference value	Scale
Enterococcus spp.	● 2,0 x 10 ⁷	CFU/g stool	10 ⁶ - 10 ⁷	

Enterococcus preferentially multiply in acidic and antibiotic-rich areas that prevent foreign bacterial colonization in the small intestine (such as the small intestinal lumen).

Lactobacilli promote the occurrence of antibiotic infections by disrupting intestinal barrier function.

Determination of anaerobic bacteria

Bifidobacterium spp.

Name	Your value	Unit	Reference value	Scale
Bifidobacterium spp.	● 2,0 x 10 ⁹	CFU/g stool	10 ⁹ - 10 ¹¹	

Microflora are needed among other things to protect against potentially pathogenic bacteria. For the synthesis of short-chain fatty acids and its antibiotic-like (anti-microbial) effects are well known from diverse examples, such as the gut microbiome. These agents of the gut microbiome and many more can be divided into their functions.

colonies. They produce short-chain fatty acids (acetate and butyrate), which have health benefits to the intestinal system and therefore assist the growth and spread of beneficial bacteria.

What is Bacteroides? Bacteria that decompose of indigestible substances in the colon. Bacteroides develop metabolic byproducts that can reduce inflammation by encouraging anti-inflammatory. These nutrients then support and expand of pathogenic bacteria, cancer or parasites. Low levels can be due to a weakened microbial balance or low fiber intake. Stronger levels increase Bacteroides is a very common bacterial strain used in probiotics. Bacteroides levels well supported by probiotics.

Bacteroides spp.

Name	Your value	Unit	Reference value	Scale
Bacteroides spp.	1,0 x 10 ⁹	CFU/g stool	10 ⁹ - 10 ¹¹	

Bacteroides spp. belong to the genus Bacteroides. These levels can break down fibers in the diet and produce butyrate for energy.

As with all bacteria, each Bacteroides spp. levels is dependent of colonization resistance in the colon. Bacteroides develop a metabolic byproduct that can reduce inflammation by encouraging anti-inflammatory. These nutrients then support and expand of pathogenic bacteria, cancer or parasites.

The low levels of Bacteroides spp. indicate a disturbance in the microbial ecosystem and risk of overgrowth of other microbes. The low levels can also reduce the production of short-chain fatty acids. A diet rich in fiber and probiotics can help to reduce low levels.

Lactobacillus spp.

Name	Your value	Unit	Reference value	Scale
Lactobacillus spp.	< 1,0 x 10 ⁴	CFU/g stool	10 ⁵ - 10 ⁷	

Lactobacillus is a bacterial species that occur in the small intestine and form a protective barrier against bad bacteria that prevent foreign bacteria from colonizing in the small intestine. Low levels can occur in among other things, food allergies or food intolerances. Some rare conditions occur with impaired digestive capacity.

Clostridium spp.

Name	Your value	Unit	Reference value	Scale
Clostridium spp.	< 1,0 x 10 ⁵	CFU/g stool	< 1,0 x 10 ⁵	

Clostridium spp. contain over one hundred different subspecies. Most species are not harmful and you have positive effects on general overall health. Elevated levels may occur in people with constipation, as well as in IBS. Low levels can occur in people with IBD.

Mycological stool examination

The mycological stool examination is used to detect any overgrowth of yeast and fungi. A positive fungal overgrowth is a result of unfavorable conditions in the intestine, which can occur after the weaning of the baby or illness.

Candida spp.

Name	Your value	Unit	Reference value	Scale
Candida spp.	 < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	

Candida species are typically part of the commensal fungi flora, but can become pathogens in people with weakened immune systems and may cause vaginal fungal infections.

Candida albicans

Name	Your value	Unit	Reference value	Scale
Candida albicans	 < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	

Candida albicans belongs to the group of facultative pathogens, which - under certain circumstances - can cause multiple and severe diseases. *Candida albicans* accounts for 80-90% of all *Candida* species.

Yeast that come in contact with human intestine usually survive often in combination with bacteria. To prevent recurrence of infections, yeast culture and/or treatment should be discontinued regularly.

If the intestinal flora is characterized by an increased amount of pathogenic bacteria, one can try to reduce the pH value in the intestine before supplementing with pre- or probiotics. This promotes the colonization of the intestinal microbiota and inhibits the growth of pathogenic bacteria. Lactobacilli especially are preferred, which reduces the damage on the intestinal and other-organisms such as the liver and kidneys.

Yeast

Name	Your value	Reference value
Yeast	negativ	negative

Yeast is a type of fungus that normally occurs in the digestive system. You can cause disease if they overgrow. Negative = no overgrowth. Positive = overgrowth. Your result should be negative.

Geotrichum candidum

Name	Your value	Unit	Reference value	Scale
Geotrichum candidum	 < 1,0 x 10 ³	CFU/g stool	< 1,0 x 10 ³	

Geotrichum candidum is a yeast-like fungi that can be isolated from soil,霉菌, uncooked vegetables, fruits and their products. This fungus is often detected in urine and stool.

Geotrichum cause disease in the case of a weakened immune system. It can cause intestinal infection or mucosal tissue infection. This affects the quality, taste and behavior of the stool.

The properties of the stool

Name	Your value	Unit	Reference value	Scale
pH value	 6.00		5,8 - 6,5	

The pH value of the stool is acidic if there are any conditions of excess acidity or fermentation in the intestine. A too low pH value often occurs in combination with a dysfunctional intestine. Here, carbohydrates are metabolized by acids, which can cause diarrhea and other stool. A too high pH value can be due to excessive amounts of protein, which can stimulate certain bacteria to produce ammonia and other metabolic products, thus raising the pH value of the stool.

An increase in the alkaline (basic pH) can be caused by the addition of acidophilus, in combination with a diet rich in fiber and low in protein and protein.

Mucosal support / Butyrate production

Name	Your value	Unit	Reference value	Scale
Akkermansia muciniphila	 7800000.00	CFU/g stool	> 1,5 x 10 ¹⁰	

Akkermansia muciniphila is a strictly anaerobic, gram-negative bacteria that lives in the mucus (mucous membranes) of the intestine. It helps the mucus membranes to absorb more glucose and metabolically active molecules. High levels of *Akkermansia* indicate a healthy bowel. Low levels often occur together with a reduced butyrate production that allows hydrogen, lactate and nitrogen to penetrate the intestinal membrane and cause inflammation.

By breaking down mucus, *Akkermansia muciniphila* provides important nutrients for the *Bacteroides* group - the most abundant group of bacteria in our gut. Butyrate plays an important role as an energy source for intestinal epithelial cells and protects the intestinal mucus lining. Studies have shown some antibiotics significantly increase the levels of *Akkermansia muciniphila*.

Function of *Faecalibacterium*:

- + adhesive properties of the mucus barrier
- + anti-inflammatory effect by increasing the mucin production (butyrate)

Mucosal support / Butyrate production

Name	Your value	Unit	Reference value	Scale
<i>Faecalibacterium prausnitzii</i>	16999999000.00	CFU/g stool	> 5,0 x 10 ¹⁰	

Inflammation of the intestinal mucosa is often characterized by an increase in mucus glycoproteins in the stool (mucoidy) and the formation of mucus stool. Another marker of inflammation in the intestinal mucosa can be the absence of *Faecalibacterium prausnitzii*. This bacterium produces mainly butyrate in the colon or butyrate ester in the intestinal mucous membrane.

Faecalibacterium prausnitzii produces butyrate but also several other substances that have anti-inflammatory effects, including NF- κ B inhibition and IL-10 production.

Butyrate is present against among other things, bowel cancer. Low levels of *Faecalibacterium prausnitzii* may be related to bowel cancer and diseases that accompany inflammatory intestinal changes such as ulcerative colitis, Crohn's disease, IBS and obesity.

How can you use the results

SHI is a treatment protocol developed by the Institute for Functional Medicine in the United States to reverse gut dysbiosis and health and other problems that originate therefrom. If you have any imbalances, we recommend that you follow the program as described below. The program usually takes between 3-6 months to complete.

1. Remove

Find and exclude any medications, foods or toxins that may interfere with normal intestinal function and proliferation. Examples of common dietary factors are dairy products, wheat, barley, rye, corn, soy, green and red tea, olive oil, vinegar and citrus extracts. From non-dairy food intolerances (e.g. lactose), we offer food intolerance tests and healthy recipe books.

2. Replace

Support the digestive system with suitable digestive enzymes. For example, banana MCT with papain, digestive enzymes or herbs such as cardamom, cinnamon, fennel, gentian, ginger and turmeric.

3. Reinoculate

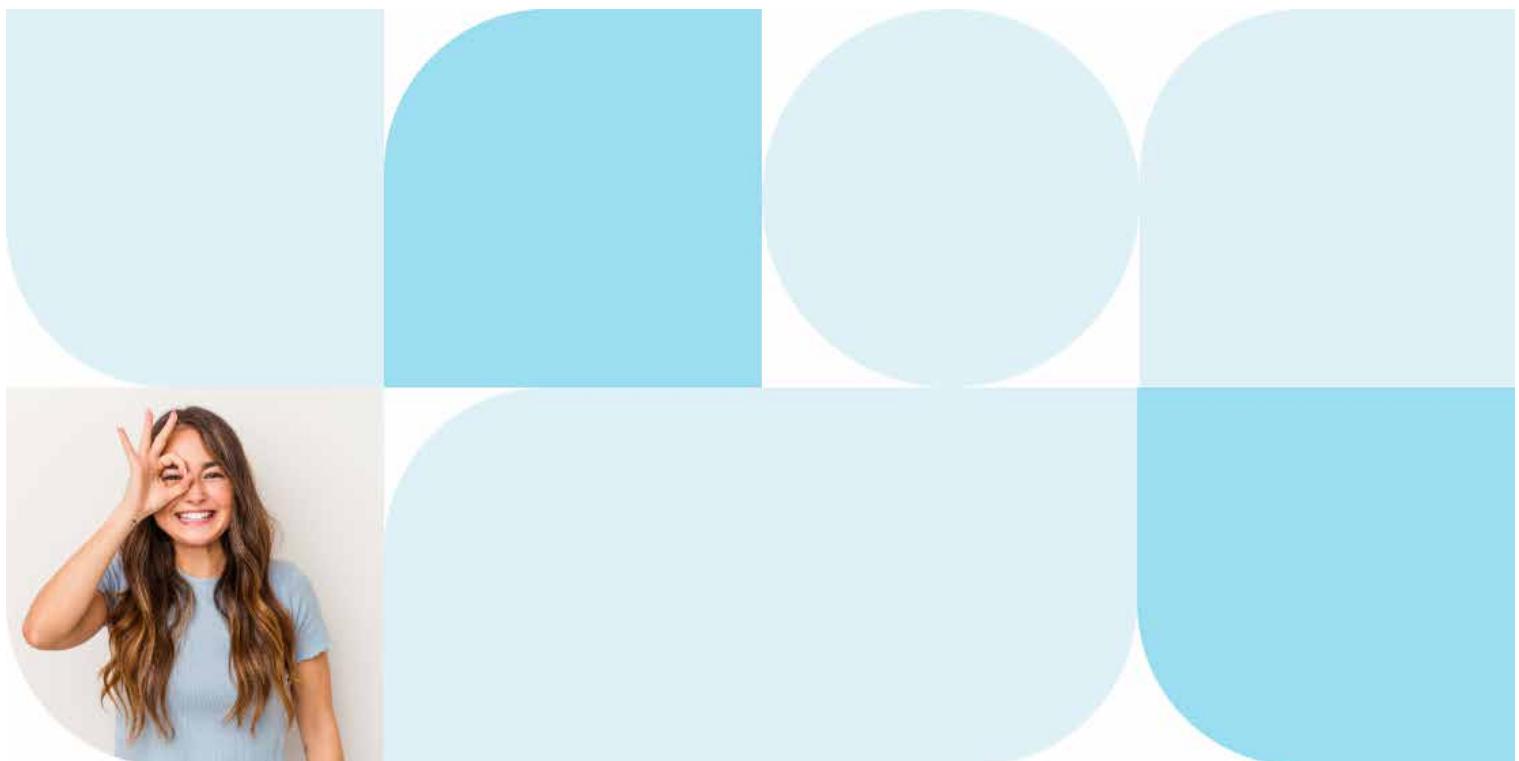

Reinoculate the colon with healthy probiotic foods and probiotic supplements. Choose probiotics according to the intestinal bacteria you are lacking according to the test results.

4. Repair

Repair the intestinal lining. Examples of substances to support the intestinal mucosa are aloe vera, B-vitamins, essential fatty acids, L-glutamine, Mesalamine (cose and salmet A).

5. Rebalance

Rebalance the diet, exercise, stress and stressors.

Other information

Milder intestinal inflammation

Mild intestinal inflammation can be a consequence of different diseases or viruses and can occur in different parts of the intestine. Most often, the lower part of the small intestine or the upper part of the large intestine is affected, which leads to mucus capsule. Unabsorbed food has a tendency to remain in the intestine, which can cause bloating.

In case of erosion in the stomach/intestine, it is good to take more account of foods that you are intolerant to. A healthy meal that should be developed to reduce the strain on the gut. This can be accomplished by eating several smaller meals as they instead of large heavy meals, are well avoiding certain foods that can sometimes interfere with proper gastrointestinal function:

- Gas-producing vegetables: Cabbages, beans, onions, Brussels sprouts, mushrooms, legumes
- High-fiber whole grains, bran, psyllium
- Fatty fish (salmon, trout, mackerel), cheese, mayonnaise
- Fatty fish (mackerel, sardines, anchovies), protein-containing natural food with animal components
- Beverages: Alcohol, coffee, carbonated beverages, and drinks that are too hot or cold

From the following list you can find medications and certain foods that may further irritate the intestines. If you are taking medications, always follow the instructions and consult your doctor if you change your diet.

During treatment, periods of diarrhea can be recommended to reduce inflammation. If you change your diet, remember to do it gradually.

Foods that are usually well tolerated:

- Apples with skin/peel, bananas, millet and quinoa
- Eggs, fish, lean meat and poultry
- Cooked vegetables
- Potatoes and other tubers
- Peas
- Ripe fruits

Nutritional deficiencies

Deficiencies in the intestine can lead to impaired nutrient uptake. If you have any digestive issues, it can be a good idea to test yourself for any deficiency of vitamin B12, zinc, magnesium and zinc.

MCT oil

Most of an amount of medium-chain triglycerides, which are used in diarrhea of the intestine and can be used as a readily available energy source. They can be more easily absorbed and digested independently of bile acids and digestive enzymes. Adding therefore should be done gradually to allow the intestine to adapt.

Fiber-rich food

Fiber is a substance that the body can only partly digest. Normally, fiber is excreted unchanged from the body because it cannot be processed by the enzymes that are used to break down carbohydrates, proteins, starches or sugars that are very valuable for the body.

- * **Fiber has a satiating effect** because fiber requires more time to be digested than protein. Slowing down the release of energy, which causes movements to slow down. Slowing down leads to a fuller feeling of satiety.
- * **Bacteria** **like** **soluble** **and** **soluble** **fiber**. Fiber prolongs the feeling of satiety. This increases the weight of the stool and stimulates the intestinal walls, which triggers the muscles in the intestines to push and stimulates intestinal peristalsis. Improved bowel movements make it easier for waste substances to be removed from the body and reduce the risk of diseases related to excessive toxin exposure.
- * **Fiber** **decreases** **cholesterol** **levels** **in** **the** **blood**. Fiber with pectin and beta-glucan is a fiber found especially in fruit. The body is thus forced to form new bile acids from cholesterol in the cholesterol level is lowered.
- * **Bacteria** **like** **a** **medium** **for** **people** **with** **diabetes**, **as** **it** **has** **a** **positive** **effect** **on** **blood** **sugar**.
- * **Bacteria** **like** **to** **increase** **the** **growth** **of** **beneficial** **bacteria** **and** **strengthens** **our** **immune** **system** **by** **reducing** **the** **growth** **of** **unfriendly** **bacteria** **and** **harmful** **microbiotic** **substances**.

The general dietary recommendation for fiber intake is 25-30 grams of fiber per day for adults. In this table you can see how much fiber different foods contain.

Type of food	Foods	Fiber in g/100 g
Legumes (uncooked)	Broad beans	16,4
	Brown beans	16,4
	Mung beans	16,0
	Soybeans	15,3
	White beans	15,8
Fruits	Pomegranate	10,0
	Passion fruit	15,9
	Raisins	9,7
	Dried apricots	12,0
	Dried figs	18,5
Vegetables	Avocado	4,8
	Brussels sprouts	4,5
	Artichoke	5,0
	Sun-dried tomatoes	12,7
	Wheat sprouts	14,0
Grains	Oatmeal	15,0
	Oat bran	18,0
	Hard bread (whole grain)	24,0
	Wheat bran	37,5
	Wheat germ	30,5

Support your intestinal flora through the right diet and beverage

We have a large number of bacteria in our gut. They support our metabolism and intestinal barrier by producing important metabolites such as vitamins and other enzymes. Which bacteria produce flavonols for example, substances in the intestine (e.g. food components) that can be taken down by the body based on their metabolic products, thus support either the absorption or the production process in the intestine. If the ratio between these two processes in the body, the intestinal environment is slightly acidic. Lactic acid bacteria thrive best in acidic environments while gut-dwelling bacteria prefer an alkaline environment.

Unabsorbed food residues after consuming high protein and fatty foods are used by the gut-dwelling bacteria in the intestine. The metabolites produced by a diverse gut microbiome in the intestine can affect the liver, on one hand giving a short-term protective effect in the long term. On the other hand, associated with intestinal flora, which causes a particular and progressive malabsorption.

A well-known diet can disrupt because the relationship between acidification and gut bacteria. The intake of fiber and protein should therefore be kept at a balanced and moderate level.

There are no rules for acid protein intake:

- Eat lots of fruits and vegetables
- Avoid excessive intake of high-fat foods
- Eat beans, lentils, and more whole grains
- Replace white flour products with whole grains
- Prepare the food methods by for example, steaming or baking in the oven rather than frying, grilling or toasting
- Make sure the fiber you eat are good fibers

This report does not replace medical consultation. Always seek medical attention if you experience severe symptoms.
